DETAILED ACTION

Claim Rejections - 35 U.S.C. § 103

- 1. The following is a quotation of 35 U.S.C. 103(a) which forms the basis for all obviousness rejections set forth in this Office action:
 - (a) A patent may not be obtained though the invention is not identically disclosed or described as set forth in section 102 of this title, if the differences between the subject matter sought to be patented and the prior art are such that the subject matter as a whole would have been obvious at the time the invention was made to a person having ordinary skill in the art to which said subject matter pertains. Patentability shall not be negatived by the manner in which the invention was made.
- 2. Claims 10-12, 17-22 and 25 are rejected under 35 U.S.C. 103(a) as being unpatentable over Miller patent 4,609,465 in view of Pall patent 3,457,339.

Miller discloses a filter cartridge element comprising a permeable inner support pipe 16, a mat (plastic, cylindrical, pleated) filter element 14 therearound and a plastic filter casing having openings 15 (column 2, lines 47-58, etc.); also disclosed are end caps 12 and 13, upon installation the axial end portions of the mat filter being heat treated and compressed (hence, inherently forming a conical shape with respect to remainder of mat filter) and then being inserted into the casing such that the filter element is supported on and between the casing and pipe (column 3, lines 47-53). As also supported by figure 2 and column 2, lines 50-56, such insertion creates a fit between mat filter and casing which is tight enough to enable the disclosed function of the casing and inner support pipe to repel radially inward and outward forces on the filter mat and restrain it from swelling.

Art Unit: 1723

The claims at least differ in requiring that the plastic casing be formed as a blank sheet that has opposite ends which are bent towards each other to form a cylinder and then joined by a seam. Pall et al teach such manufacturing method in column 1, lines 42-47. Also, Miller disclose that the manufacturing methods of the Pall patent are utilized in column 3, lines 57-59. Hence, At the time the present invention was made, it would have been obvious to one of ordinary skill in this art to have constructed the plastic casing of the Miller filter to be formed of a blank sheet with ends joined by a seam, as taught by Pall, so as to provide a stable, cylindrical shape of the casing in order to maintain the integrity of the filter during filtration processes wherein inward or outward radial stresses are exhibited in the filter.

Miller and Pall are silent as to whether the mat filter initially has a larger exterior diameter than the interior diameter of the filter casing. However, At the time the present invention was made, it would have been obvious to one of ordinary skill in this art to have considered the mat filter element 14 to inherently be of such relatively larger diameter prior to its insertion into the cage 15, since preliminary manufacturing steps of heating and compressing the end pleats (resulting in decreased diameter of the ends of the mat filter element) are necessary before the mat filter may be inserted into the cage. Hence, resulting in an "interference fit" of filter mat and casing when other text portions and figures of Miller are also considered.

Regarding claims 11, 12 and 16, see Miller column 3, lines 55-59 and Pall et al column 2, lines 38-45, etc. concerning heat sealing of the seam and other components.

Art Unit: 1723

Regarding claims 17-20, see disclosure in Miller of all filter elements being comprised of PVDF, PTFE or other fluoropolymers, all well known recyclable plastics.

Regarding claim 21, claimed punching out method is deemed a product-by-process manufacturing step and hence of little patentable weight in such apparatus claim.

Regarding claim 22, see figure 3 of Miller.

Regarding claim 25, figure 2 and column 3, lines 52-53 of Miller suggest interference fit also of mat filter to supporting pipe.

3. Claims 13, 23 and 24 are rejected under 35 U.S.C. 103(a) as being unpatentable over Miller in view of Pall et al as applied to claim 10 above, and further in view of Domnick patent 3,460,680 of record.

Claim 13 further differs in requiring that the filter casing has an ultrasonic weld. Domnick teaches such weld in column 3, lines 1-3. At the time the present invention was made, it would have been obvious to one of ordinary skill in this art to have utilized such weld in the Miller apparatus to permanently maintain the shape of the casing.

Claim 23 further differs by requiring the sealing seam to comprise intermittent contact points. Domnick teaches such feature in the teaching of spot welding (column 3, lines 1-2 and column 2, lines 60-61. At the time the present invention was made, it would have been obvious to one of ordinary skill in this art to have utilized such spot welding (contact points) in the filter of Miller, as taught by Domnick, to prevent tearing of the filter medium.

Art Unit: 1723

Claim 24 also differs in requiring that the filter casing be designed to have an overlapping area of filter casing ends. Domnick teaches such construction in column 2, lines 66-71. At the time the present invention was made, it would have been obvious to one of ordinary skill in this art to have also utilized such construction of the casing in the Miller apparatus, as taught by Domnick, to provide a more secure shape of the filter casing.

- 4. Claim 14 is rejected under 35 U.S.C. 103(a) as being unpatentable over Miller in view of Pall et al as applied to claim 10 above, and further in view of Komarmy of record. Claim 14 further differs in the requirement for the extra fold of the mat filter element. However, Komarmy teaches such extra fold in column 2, lines 10-13 and figure 2. At the time the present invention was made, it would have been obvious to one of ordinary skill in this art to have modified the Miller apparatus mat filter, to more securely maintain the shape of the mat filter.
- 5. Claims 15 and 16 are rejected under 35 U.S.C. 103(a) as being unpatentable over Miller in view of Pall et al as applied to claim 14 above, and further in view of Domnick.

 Claims 15 and 16 also differ in requiring the ultrasonic weld. At the time the present invention was made, it would have been obvious to one of ordinary skill in this art to have also utilized the ultrasonic weld taught by Domnick in the filter of Miller to permanently maintain the shape of the casing.

Art Unit: 1723

Response to Arguments

6. Applicant's arguments with respect to claims 10-25 have been considered but are moot in view of the new ground(s) of rejection (i.e. interference fit along entire mat filter length.

Conclusion

7. Applicant's amendment necessitated the new ground(s) of rejection presented in this Office action. Accordingly, **THIS ACTION IS MADE FINAL.** See MPEP § 706.07(a). Applicant is reminded of the extension of time policy as set forth in 37 CFR 1.136(a).

A shortened statutory period for reply to this final action is set to expire THREE MONTHS from the mailing date of this action. In the event a first reply is filed within TWO MONTHS of the mailing date of this final action and the advisory action is not mailed until after the end of the THREE-MONTH shortened statutory period, then the shortened statutory period will expire on the date the advisory action is mailed, and any extension fee pursuant to 37 CFR 1.136(a) will be calculated from the mailing date of the advisory action. In no event, however, will the statutory period for reply expire later than SIX MONTHS from the date of this final action.

8. Any inquiry concerning this communication or earlier communications from the examiner should be directed to Joseph W. Drodge whose telephone number is (703) 308-0403. The examiner can normally be reached on Monday-Friday from approximately 8:30 AM - 4:45 PM.

Application/Control Number: 09/446,523
